Program: BS **Credit Hours:** 3 **Type:** Core
Pre-requisites (if any): CS2001 - Data Structures
Course Website (if any):
Class Meeting Time: Sec BCS-4A: Mon, Wed 11:30 AM Sec BCS-4B: Mon, Wed 2:30 PM
Class Venue: CS-3

This course is an introduction to relational databases management Systems. The course will cover fundamental concepts of databases with an emphasis on modeling, designing and implementation of database systems. The theory will be augmented with hands-on exercises on database system. A project will be conducted in the database system lab that runs in parallel with the course. In project, the students will develop a data-centric application with complete set of business transactions and appropriate user interface using a popular programming language and a popular database management system.

At the end of the course, you will be able to:

- Describe how databases store and retrieve information using the basic concepts and terminology of relational databases.
- Create an ER diagram (semantic model) about an enterprise (e.g., retail industry, airport, school, library) that correctly describes the entities, attributes, and relationships among the entities, for some of its major business functions.
- Create a logical data model from an ER diagram to design a set of DB relations.
- Normalize a set of attributes to eliminate update anomalies or redundancies from a set of relations.
- Implement a logical data model using a DBMS.
- Write queries using formal query languages such as relational algebra.
- Write SQL statements to query a set of tables in a DBMS involving multiple conditions, ordering, aggregate functions, grouping, group selection, set operations, joins, and nested queries.
- Write SQL statements to insert, delete and update a set of tables in a DBMS.
- Write SQL statements to create, alter, drop, rename a set of tables in a DBMS.
- Write SQL statements to add and drop constraints on a set of tables in a DBMS.
- Comprehend the ACID properties of Transactions and recoverability schedules.

Textbook: Ramez Elmasri, *Fundamentals of Database Systems* (7th Edition)

- Raghu Ramakrishnan, Database Management Systems (3rd Edition)
- C. J. Date, An Introduction to Database Systems (8th Edition)

Midterms (30%), Quizzes/Class Participation (10%), Assignments (10%), Final (50%)

Grading

- Minimum eligibility to pass this course is to get 50% marks.
- Academic integrity is expected of all the students. Plagiarism or cheating in any assessment will result in at least an F grade in the course, and possibly more severe penalties.

Project

Students will design, implement, demonstrate, and document a database system. The project is to be done in groups of 3/4 students. Pick your partner as soon as possible. The groups are self-policing (e.g., each group is responsible for its own division of labor, scheduling, etc.). A separate handout will be provided describing the project requirements in the 2nd week of the classes.

Tentative Course Outline and Lecture Plan

Week	Topics to be covered	Topics Detail		Readings (Textbook)	No of Lec.	Asst.
1	Introduction to Databases	<ul style="list-style-type: none">• Databases and Database Users• Characteristics of the Database Approach• Advantages of Using the DBMS Approach• Data Models, Schemas, Instances• Architecture and Components of a DBMS		Ch 1,2	2	
2-3	Relational Data Model	RA <ul style="list-style-type: none">• Relational Model Concepts<ul style="list-style-type: none">o Domain, Attributes, Tuples, Relationso Characteristics of Relations• Relational Model Constraints<ul style="list-style-type: none">o Domain, Keys, Integrity• Update Operations and Dealing with Constraint Violation	SQL <ul style="list-style-type: none">• Data Definition Statements (DDL)<ul style="list-style-type: none">o Create, Alter, Drop, Rename• Specifying Constraints<ul style="list-style-type: none">o Attribute, Key, Referential Integrity, Tuple-Based Using CHECK• Data Modification Statements (DML)<ul style="list-style-type: none">o Insert, Update, Delete	Ch 5, 6	4	A1
4-6	Formal Query Language: Relational Algebra and The Database Language: SQL	RA <ul style="list-style-type: none">o Unary Relational Operations<ul style="list-style-type: none">o SELECT, PROJECT, RENAMEo Binary Operations<ul style="list-style-type: none">o Union, Intersection, Difference, Divisiono Cartesian Product, JOIN<ul style="list-style-type: none">o Outer Join, Outer Union, Fullo Aggregate Functions and Grouping	SQL <ul style="list-style-type: none">o Retrieval Queries<ul style="list-style-type: none">o Basic Queries: SELECT-FROM-WHEREo Ordering, Arithmetic Operations, Substring Comparisono Set Operationso Joining, Full, outer, inner, Crosso Aggregate Functions and Groupingo Nested Queries<ul style="list-style-type: none">o Correlated Nested Querieso Views (Virtual Tables), Stores Procedures, Assertions and Triggers	Ch 6, 7, 8	6	A2, A3
7-9	Database Design Theory and Normalization	<ul style="list-style-type: none">• Design Anomalies• Informal Design Guidelines for Relational Databases• Functional Dependencies (FDs)<ul style="list-style-type: none">o Convert Business statements into Dependencieso Armstrong's Inference Rules for FDso Algorithm for computing Attribute Closureo Minimal Cover of FDso Equivalence of Sets of FDs• Normalization for Relational databases<ul style="list-style-type: none">o Normalization and De-Normalizationo Normal Forms: 1NF, 2NF, 3NF, BCNF, 4NF, 5NF• Overview of Relational Database Design Algorithms		Ch 14, 15	6	A4

10-12	Data Modeling Using Entity-Relationship (ER) Model	<ul style="list-style-type: none"> • Entity Types, Entity Sets, Attributes, Keys • Relationship Types, Relationship Sets, Roles • Constraints on Relationship Types • Relationship Types of Degree Higher than Two • Enhanced Entity-Relationship (EER) Model Concepts • Subclasses, Superclasses, Inheritance • Specialization and Generalization • Constraints and Characteristics of Specialization and Generalization • Shared and UNION Type subclasses 	Ch 3, 4	5	A5
12-13	Relational Database Design by ER- and EER-to-Relational Mapping	<ul style="list-style-type: none"> • Mapping ER Model Constructs to Relations • Mapping EER Model Constructs to Relations 	Ch 9	2	
13-14	Transaction Processing Concepts	<ul style="list-style-type: none"> • Issues in Transaction Processing • Why Concurrency Control is Needed • Why Recovery is Needed • Transaction States and Operations, System Log, Commit Point of a Transaction • ACID Properties of Transactions • Characterizing Schedules based on Recoverability • Characterizing Schedules based on Serializability • Transactions Isolation Levels and Possible Violations • Basic Two-Phase Locking Technique for Concurrency Control 	Ch 20	3
